

SAF SERIES PILLOW BLOCKS

FEATURING SAF500 SERIES ASSEMBLY COMPONENTS AND DIMENSIONS

STAY IN MOTION. STAY IN CONTROL.

Optimum Protection. Optimum Performance.

NSK's SAF series pillow blocks are designed to provide robust performance in a wide range of applications and challenging operating conditions. Manufactured from cast iron - with ductile iron and cast steel options, they possess a number of engineered advantages including strength to withstand substantial mechanical shock, resistance to corrosion and resilience in extreme temperatures. With standard features to accommodate high and low speeds, grease and oil lubrication, NSK SAF pillow blocks also offer optional seal arrangements to ensure protection against environmental contamination and optimum bearing service life.

DESIGN FEATURES

- Manufactured from cast iron
- Also available in ductile iron (SAFD) and cast steel (SAFS)
- Wide variety of series/sizes for shafts as large as 10 1/2"
- Equipped with multiple re-lubrication points and large inlet holes
- Internal cross-porting for improved oil flow
- Landing platform accommodates external sensors and lubrication systems
- Delivered with labyrinth seal and fixing ring included

OPERATING BENEFITS

- Preserves optimum bearing lubrication and prevents ingress of contaminants
- Optional seal designs available for increasingly contaminated environments
- Resistant to corrosion, mechanical shock and resilient in extreme temperatures
- Split design facilitates simplified mounting and dismounting
- Dimensionally interchangeable for replacement of competitive designs

POPULAR SERIES

SAF600	1 7/16" - 7 3/16"	13 / 23 / 213 / 223

SEAL OPTIONS

LER

Series SAF pillow blocks come equipped with a non-contact LER standard labyrinth seal. This efficient general duty floating seal is self-locating within the seal grooves of the housing and is well suited for high speeds in operating environments with minimal risks of contamination. (Fig. 1)

LER-DC

LER-DC dust covers / wiper seals can be used in conjunction with both LER and PER seals to provide an additional barrier to contaminants. The machined face of the SAFD pillow block provides an ideal contact surface for the LER-DC to shroud the seal area and create an additional cost-efficient labyrinth. (Fig. 1)

PER/PER-PTV

PER seals are dimensionally interchangeable with the LER, and feature the inclusion of an O-ring seal for a snug fit to the assembly shaft (causing the PER to rotate with the shaft). PER-PTV is a lip contact seal installed over the PER and within the housing seal grooves. The PTV seal facilitates slow purging of the grease within the assembly, creating a barrier from contaminants. The lip contact seal can also be reversed to retain the grease within the assembly for applications where risk of contamination is moderate, or access for re-lubrication is difficult. (Fig. 2)

TER-OS

TER-OS taconite seals are designed to prevent the ingress of contaminants in the most severe service conditions. They are equipped with a shaft contact spring-loaded oil seal, a grease-charged channel, a felt shaft seal and an O-ring seal in the housing labyrinth to form a virtually impenetrable barrier and provide a tight, yet flexible fit. (Fig. 3)

(1) Low speed applications generally involve conveyors. Bearings exposed to weather are better off relatively full to deter moisture from entering.

(2) Higher speed applications do not require as much grease, as purging of excess will occur at the seals naturally.
